???? As You can use these programs for repair, such as freefix. This invention relates to surface mounting of a semiconductor device. In a surface mounting, a semiconductor chip is mounted on a conductor pattern by bonding a metal film such as a copper film to the conductor pattern. FIG. 1 shows a part of a mounting method of the prior art. In the drawing, a substrate 1 having a conductor pattern 3 formed on its surface is placed in a vacuum chamber (not shown) and a vacuum pump is operated so that the vacuum chamber may be kept at a vacuum. A mask 2 is mounted on the lower surface of the substrate 1 to keep the upper surface of the substrate 1 in a clean atmosphere. Then, in the vacuum chamber, the vacuum pump is operated and a high pressure source is connected to the vacuum chamber. Then, a nozzle 5 is inserted to the center of the substrate 1 so as to inject a cleaning liquid in the form of a mist at a predetermined pressure. The substrate 1 is rotated so that the cleaning liquid may be spread on the whole upper surface of the substrate 1, thereby cleaning the upper surface of the substrate 1. Then, a heating pipe 4 is inserted to the lower surface of the substrate 1 and the upper surface of the substrate 1 is heated to a predetermined temperature. As a result, the bonding of the metal film 6 to the conductor pattern 3 is changed to a molten state and thus the metal film 6 can be bonded to the conductor pattern 3. Thereafter, the mask 2 is taken out from the vacuum chamber and then the substrate 1 is taken out from the vacuum chamber. According to this method, however, a mist 7 of the cleaning liquid is left on the upper surface of the substrate 1 in the vacuum chamber, and the mist 7 is vaporized at a temperature lower than the boiling point of the cleaning liquid, e.g., the mist 7 is vaporized at about room temperature. Thus, the substrate 1 may be polluted. Also, after taking out the substrate 1 from the vacuum chamber, it takes a time until the whole mist 7 on the upper surface of the substrate 1 is evaporated, and thus the possibility is high that an oxide film and/or other contaminating substances will be formed on the upper surface of the substrate 1.Q: jQuery \$(window).load() stops working with only one image loaded I have a webpage that has 82157476af
